## Two-step approach to Calculating Derived PDF

- Calculate the PDF of a Function  $Y = g(X)$  of a continuous random variable  $X$

1. Calculate the CDF  $F_Y$  of  $Y$  using the formula

$$F_Y(y) = \mathbf{P}(g(X) \leq y) = \int_{\{x | g(x) \leq y\}} f_X(x) dx$$

2. Differentiate to obtain the PDF (called the derived distribution) of  $Y$

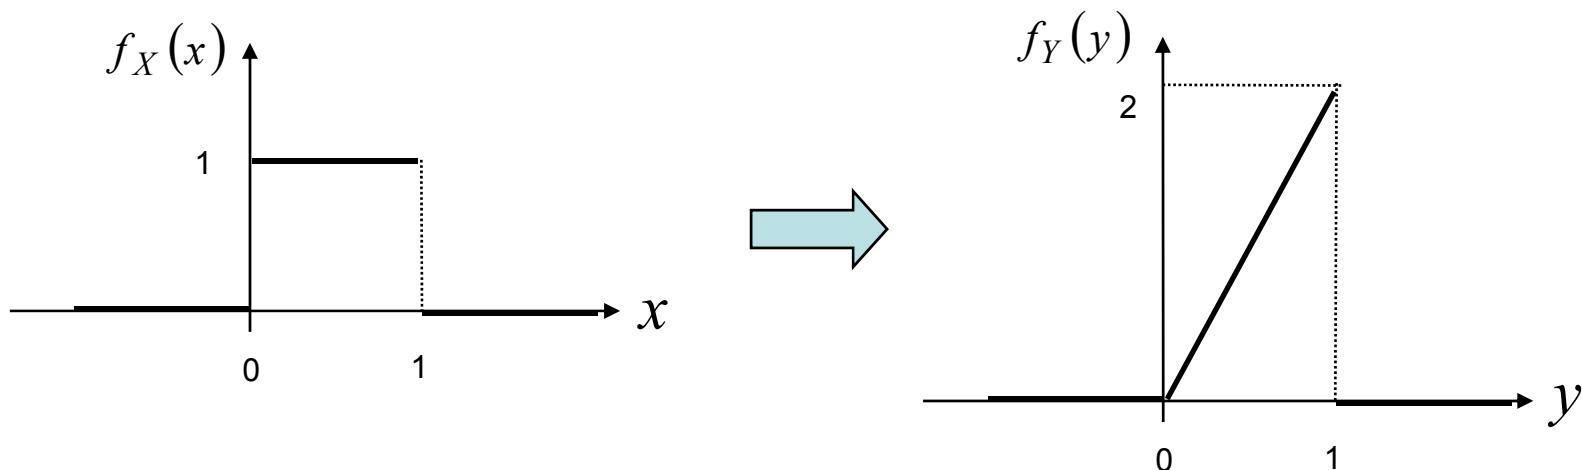

$$f_Y(y) = \frac{dF_Y(y)}{dy}$$

## Illustrative Examples (1/2)

- **Example 3.20.** Let  $X$  be uniform on  $[0, 1]$ . Find the PDF of  $Y = \sqrt{X}$ . Note that  $Y$  takes values between 0 and 1.

$$F_Y(y) = \mathbf{P}(Y \leq y) = \mathbf{P}(\sqrt{X} \leq y) = \mathbf{P}(X \leq y^2) = y^2$$

$$\therefore f_Y(y) = \frac{dF_Y(y)}{dy} = 2y, \quad 0 \leq y \leq 1$$

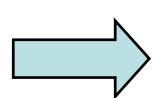

## Illustrative Examples (2/2)

- **Example 3.22.** Let  $Y = X^2$ , where  $X$  is a random variable with known PDF  $f_X(x)$ . Find the PDF of  $Y$  represented in terms of  $f_X(x)$ .

For any  $y \geq 0$ , we have

$$\begin{aligned}F_Y(y) &= \mathbf{P}(Y \leq y) = \mathbf{P}(X^2 \leq y) \\&= \mathbf{P}(-\sqrt{y} \leq X \leq \sqrt{y}) \\&= F_X(\sqrt{y}) - F_X(-\sqrt{y})\end{aligned}$$

$$\begin{aligned}f_Y(y) &= \frac{dF_Y(y)}{dy} \\&= \left[ \frac{dF_X(\sqrt{y})}{d\sqrt{y}} \cdot \frac{d\sqrt{y}}{dy} \right] - \left[ \frac{dF_X(-\sqrt{y})}{d(-\sqrt{y})} \cdot \frac{d(-\sqrt{y})}{dy} \right] \\&= \frac{1}{2\sqrt{y}} f_X(\sqrt{y}) + \frac{1}{2\sqrt{y}} f_X(-\sqrt{y}) \\&= \frac{1}{2\sqrt{y}} [f_X(\sqrt{y}) + f_X(-\sqrt{y})]\end{aligned}$$

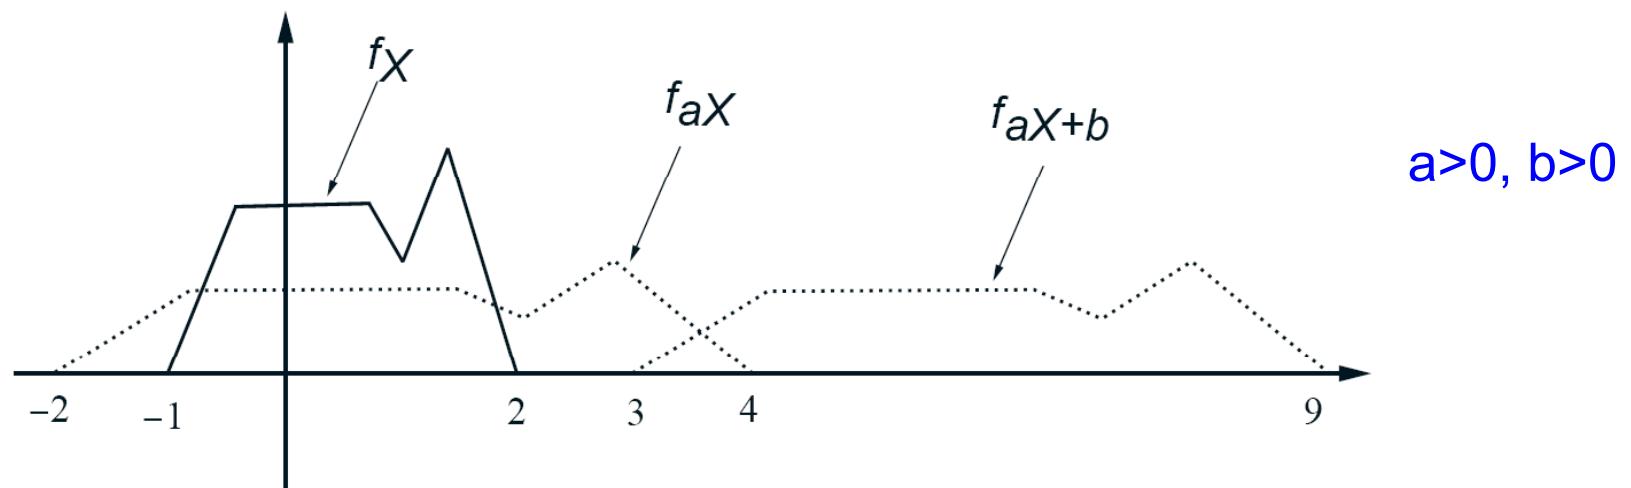

# The PDF of a Linear Function of a Random Variable

- Let  $X$  be a continuous random variable with PDF  $f_X(x)$ , and let

$$Y = aX + b,$$

for some scalar  $a \neq 0$  and  $b$ . Then,

$$f_Y(y) = \frac{1}{|a|} f_X\left(\frac{y-b}{a}\right)$$

# The PDF of a Linear Function of a Random Variable (1/2)

- Verification of the above formula

$$F_Y(y) = \mathbf{P}(Y \leq y) = \mathbf{P}(aX + b \leq y)$$

(i) For  $a > 0$

$$F_Y(y) = \mathbf{P}\left(X \leq \frac{y-b}{a}\right) = F_X\left(\frac{y-b}{a}\right)$$

$$\Rightarrow f_Y(y) = \frac{dF_X\left(\frac{y-b}{a}\right)}{d\left(\frac{y-b}{a}\right)} \cdot \frac{d\left(\frac{y-b}{a}\right)}{dy} = \frac{1}{a} f_X\left(\frac{y-b}{a}\right)$$

(ii) For  $a < 0$

$$F_Y(y) = \mathbf{P}\left(X \geq \frac{y-b}{a}\right) = 1 - F_X\left(\frac{y-b}{a}\right)$$

$$\Rightarrow f_Y(y) = -\frac{dF_X\left(\frac{y-b}{a}\right)}{d\left(\frac{y-b}{a}\right)} \cdot \frac{d\left(\frac{y-b}{a}\right)}{dy} = -\frac{1}{a} f_X\left(\frac{y-b}{a}\right)$$

$$\therefore f_Y(y) = \frac{1}{|a|} f_X\left(\frac{y-b}{a}\right)$$

## Illustrative Examples (1/2)

- **Example 3.23. A linear function of an exponential random variable.**
  - Suppose that  $X$  is an exponential random variable with PDF

$$f_X(x) = \begin{cases} \lambda e^{-\lambda x}, & \text{if } x \geq 0, \\ 0, & \text{otherwise.} \end{cases}$$

- where  $\lambda$  is a positive parameter. Let  $Y = aX + b$ . Then,

$$f_Y(y) = \begin{cases} \frac{1}{|a|} \lambda e^{-\lambda(y-b)/a}, & \text{if } (y-b)/a \geq 0, \\ 0, & \text{otherwise.} \end{cases}$$

## Illustrative Examples (2/2)

- **Example 3.24. A linear function of a normal random variable is normal.**

- Suppose that  $X$  is a normal random variable with mean  $\mu$  and variance  $\sigma^2$ ,

$$f_X(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}, \quad -\infty \leq x \leq \infty$$

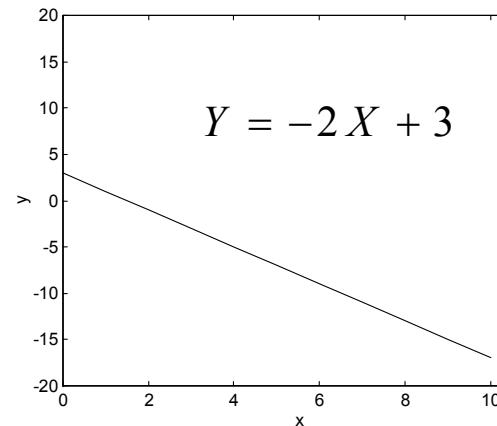

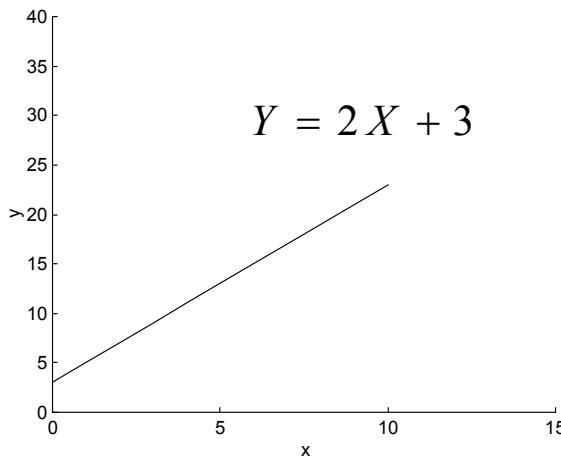

- And let  $Y = aX + b$ , where  $a$  and  $b$  are some scalars. We have

$$f_Y(y) = \frac{1}{|a|} f_X\left(\frac{y-b}{a}\right)$$

$$\begin{aligned} &= \frac{1}{|a|} \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{\left(\frac{y-b}{a}-\mu\right)^2}{2\sigma^2}} \quad \therefore Y \text{ is also a normal random variable} \\ &\quad \text{with mean } a\mu + b \text{ and variance } a^2\sigma^2 \\ &= \frac{1}{\sqrt{2\pi}|a|\sigma} e^{-\frac{(y-(b+a\mu))^2}{2a^2\sigma^2}}, \quad -\infty \leq y \leq \infty \end{aligned}$$

# Monotonic Functions of a Random Variable (1/4)

- Let  $X$  be a continuous random variable and have values in a certain interval  $I$  ( $f_X(x) = 0$  for  $x \notin I$ ). While random variable  $Y = g(X)$  and we assume that  $g$  is **strictly monotonic** over the interval  $I$ . That is, either
  - (1)  $g(x) < g(x')$  for all  $x, x' \in I$ , satisfying  $x < x'$  **(monotonically increasing case)**, or
  - (2)  $g(x) > g(x')$  for all  $x, x' \in I$ , satisfying  $x < x'$  **(monotonically decreasing case)**

## Monotonic Functions of a Random Variable (2/4)

- Suppose that  $g$  is monotonic and that for some function  $h$  and all  $x$  in the range  $I$  of  $X$  we have

$$y = g(x) \quad \text{if and only if } x = h(y)$$

- For example,

$$y = g(x) = ax + b \quad \Rightarrow \quad x = h(y) = \frac{y - b}{a}$$

$$y = g(x) = e^{ax} \quad \Rightarrow \quad x = h(y) = \frac{\ln y}{a}$$

$$y = g(x) = -ax + b \quad \Rightarrow \quad x = h(y) = -\frac{y - b}{a}$$

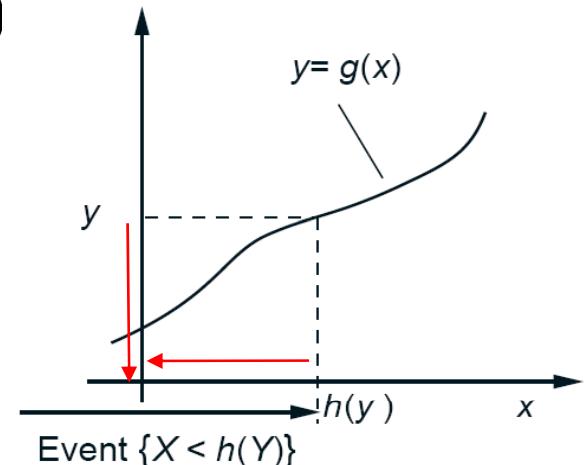

# Monotonic Functions of a Random Variable (3/4)

- Assume that  $h$  has first derivative  $\frac{dh(y)}{dy}$ . Then the PDF of  $Y$  in the region where  $f_Y(y) > 0$  is given by

$$f_Y(y) = f_X(h(y)) \left| \frac{dh(y)}{dy} \right|$$

- For the monotonically increasing case

$$\begin{aligned} F_Y(y) &= \mathbf{P}(g(X) \leq y) = \mathbf{P}(X \leq h(y)) = F_X(h(y)) \\ \Rightarrow f_Y(y) &= \frac{dF_Y(y)}{dy} \\ &= \frac{dF_X(h(y))}{dy} = \frac{dF_X(h(y))}{dh(y)} \cdot \frac{dh(y)}{dy} \\ &= f_X(h(y)) \cdot \frac{dh(y)}{dy} \quad \frac{dh(y)}{dy} > 0 \end{aligned}$$

# Monotonic Functions of a Random Variable (4/4)

- For the monotonically decreasing case

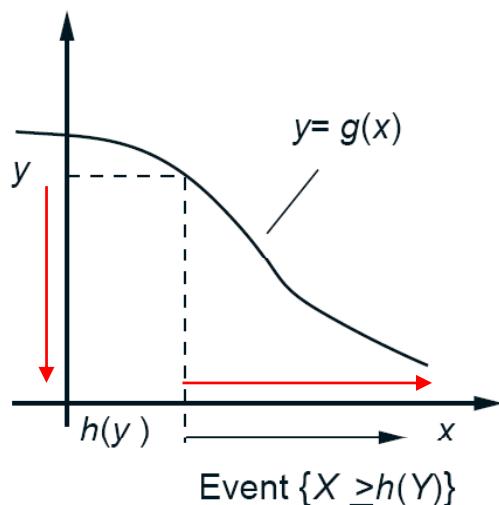

$$F_Y(y) = \mathbf{P}(g(X) \leq y) = \mathbf{P}(X \geq h(y)) = 1 - F_X(h(y))$$

$$\Rightarrow f_Y(y) = \frac{dF_Y(y)}{dy}$$

$$= -\frac{dF_X(h(y))}{dy} = -\frac{dF_X(h(y))}{dh(y)} \cdot \frac{dh(y)}{dy}$$

$$= -f_X(h(y)) \cdot \frac{dh(y)}{dy}$$

$$\frac{dh(y)}{dy} < 0$$

## Illustrative Examples (1/5)

- **Example 3.25.** Let  $Y = g(X) = X^2$ , where  $X$  is a continuous uniform random variable in the interval  $(0, 1]$ .
  - What is the PDF of  $y$  ?
    - Within this interval,  $g$  is strictly monotonic, and its inverse is  $h(y) = \sqrt{y}$

We have

$$f_X(x) = 1 \quad \text{for all } 0 < x \leq 1$$

and  $g(X)$  being strictly increasing

$\Rightarrow$

$$f_X(\sqrt{y}) = 1, \quad \text{for all } 0 < y \leq 1$$

$$\therefore f_Y(y) = \frac{dh(y)}{dy} f_X(\sqrt{y}) = \begin{cases} \frac{1}{2\sqrt{y}}, & \text{if } y \in (0, 1] \\ 0, & \text{otherwise} \end{cases}$$

## Illustrative Examples (2/5)

- **Example 3.26.** Let  $X$  and  $Y$  be independent random variables that are uniformly distributed on the interval  $[0, 1]$ , respectively. What is the PDF of the random variable  $Z = \max \{X, Y\}$

$$\begin{aligned}F_Z(z) &= \mathbf{P}(\max \{X, Y\} \leq z) \\&= \mathbf{P}(X \leq z, Y \leq z) \\&= \mathbf{P}(X \leq z)\mathbf{P}(Y \leq z) \\&= z^2\end{aligned}$$

$$\therefore f_Z(z) = \begin{cases} 2z, & \text{if } 0 \leq z \leq 1 \\ 0, & \text{otherwise} \end{cases}$$

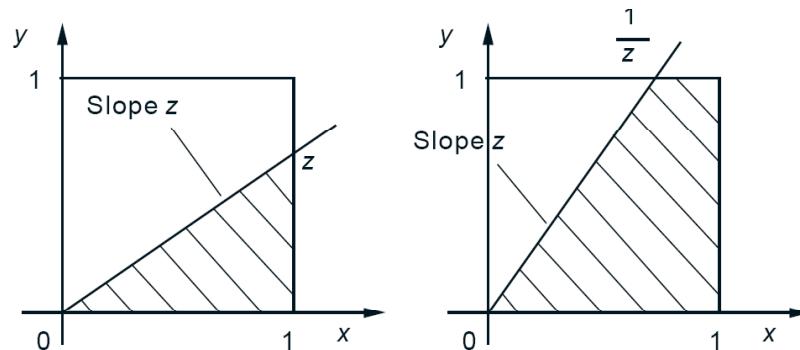

## Illustrative Examples (3/5)

- Example 3.27.** Let  $X$  and  $Y$  be independent random variables that are uniformly distributed on the interval  $[0, 1]$ . What is the PDF of the random variable  $Z = Y / X$

$\because X, Y$  are independent

$$\therefore f_{X,Y}(x,y) = f_X(x)f_Y(y) = 1,$$

for all  $x, y, 0 \leq x, y \leq 1$

$$F_Z(z) = P(Y/X \leq z)$$

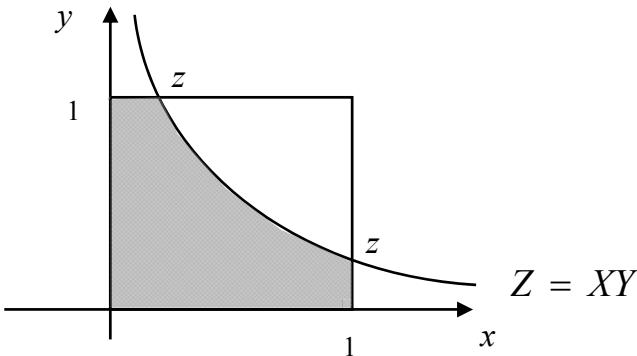

$$= \begin{cases} z/2, & \text{if } 0 \leq z \leq 1 \\ 1 - (1/2z), & \text{if } z > 1 \\ 0, & \text{otherwise} \end{cases}$$

$$\Rightarrow f_Z(z) = \begin{cases} 1/2, & \text{if } 0 \leq z \leq 1 \\ 1/(2z^2), & \text{if } z > 1 \\ 0, & \text{otherwise} \end{cases}$$

## Illustrative Examples (4/5)

- Extra Example.** Let  $X$  and  $Y$  be independent random variables that are uniformly distributed on the interval  $[0, 1]$ , respectively. What is the PDF of the random variable

$$Z = XY$$

for  $0 < z \leq 1$

$$F_Z(z) = P(XY \leq z)$$

$$= \int_0^z \int_0^1 f_{X,Y}(x, y) dy dx + \int_z^1 \int_0^{\frac{z}{x}} f_{X,Y}(x, y) dy dx$$

$$= \int_0^z \int_0^1 1 dy dz + \int_z^1 \frac{z}{x} dx$$

$$= z + z \ln x \Big|_z^1$$

$$= z - z \ln z$$

$\Rightarrow$  for  $0 < z \leq 1$ ,

$$f_Z(z) = \ln z$$

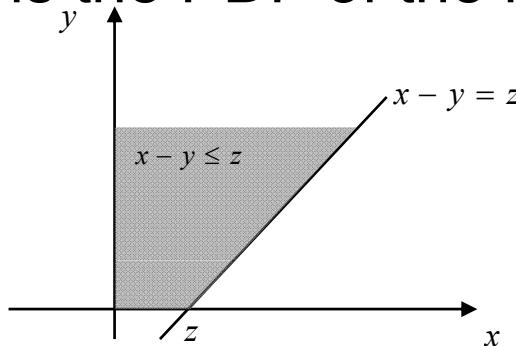

For example,

$$F_Z(1/8) = P(XY \leq 1/8)$$

$$= \frac{1}{8} - \frac{1}{8} \ln \frac{1}{8} = \frac{1}{8} + \frac{3}{8} \ln 2$$

## Illustrative Examples (5/5)

- Example 3.27.** Let  $X$  and  $Y$  be independent random variables that are exponential distributed with parameter  $\lambda$ . What is the PDF of the random variable  $Z = X - Y$

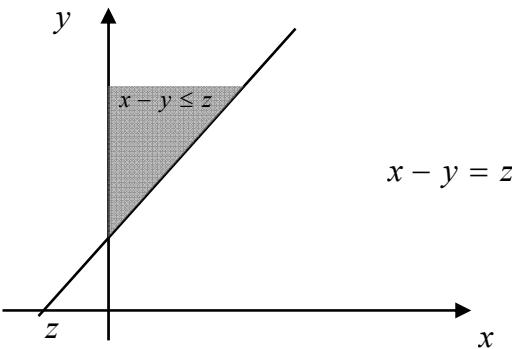

for  $z \geq 0$

$$\begin{aligned}
 F_Z(z) &= P(X - Y \leq z) \\
 &= \int_0^\infty \int_0^{y+z} f_{X,Y}(x,y) dx dy \\
 &= \int_0^\infty \int_0^{y+z} \lambda e^{-\lambda y} \lambda e^{-\lambda x} dx dy \\
 &= \int_0^\infty \lambda e^{-\lambda y} \left( \int_0^{y+z} \lambda e^{-\lambda x} dx \right) dy \\
 &= \int_0^\infty \lambda e^{-\lambda y} \left( -e^{-\lambda x} \Big|_0^{y+z} \right) dy \\
 &= \int_0^\infty \lambda e^{-\lambda y} dy - \int_0^\infty e^{-\lambda z} \lambda e^{-2\lambda y} dy \\
 &= 1 - \frac{1}{2} e^{-\lambda z}
 \end{aligned}$$

⇒ for  $z \geq 0$ ,

$$f_Z(z) = \frac{1}{2} e^{-\lambda z}$$

for  $z \leq 0$

$$\begin{aligned}
 F_Z(z) &= P(X - Y \leq z) \\
 &= \int_{-z}^\infty \int_0^{y+z} f_{X,Y}(x,y) dx dy \\
 &= \int_{-z}^\infty \int_0^{y+z} \lambda e^{-\lambda y} \lambda e^{-\lambda x} dx dy \\
 &= \int_{-z}^\infty \lambda e^{-\lambda y} \left( \int_0^{y+z} \lambda e^{-\lambda x} dx \right) dy \\
 &= \int_{-z}^\infty \lambda e^{-\lambda y} \left( -e^{-\lambda x} \Big|_0^{y+z} \right) dy \\
 &= \int_{-z}^\infty \lambda e^{-\lambda y} dy - \frac{1}{2} e^{-\lambda z} \int_{-z}^\infty 2 \lambda e^{-2\lambda y} dy \\
 &= e^{\lambda z} - \frac{1}{2} e^{-\lambda z} e^{2\lambda z} \\
 &= \frac{1}{2} e^{\lambda z}
 \end{aligned}$$

# Recitation

- SECTION 3.6 Derived Functions
  - Problems 30, 31, 36, 38, 39

## An Extra Example

- Let  $X$  and  $Y$  be independent random variables that are uniformly distributed on the interval  $[0, 1]$ , respectively.  
What is the PDF of the random variable  $Z = \max \{2X, Y\}$

Let  $X' = 2X \Rightarrow X'$  is uniformly distributed on  $[0, 2]$

with PDF  $f_{X'}(x') = \frac{1}{2}$

$$\begin{aligned} F_Z(z) &= \mathbf{P}(\max \{2X, Y\} \leq z) = \mathbf{P}(\max \{X', Y\} \leq z) \\ &= \mathbf{P}(X' \leq z, Y \leq z) \\ &= \mathbf{P}(X' \leq z) \mathbf{P}(Y \leq z) \end{aligned}$$

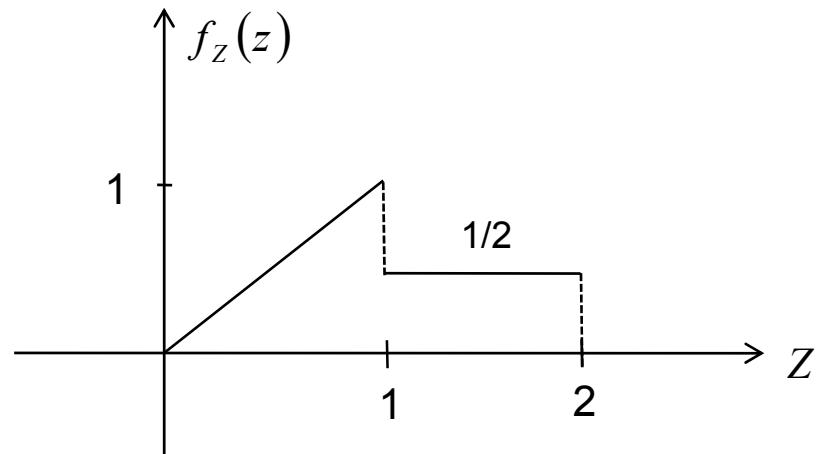

if  $0 \leq z \leq 1$

$$\Rightarrow F_Z(z) = \frac{1}{2}z \cdot z = \frac{1}{2}z^2$$

if  $1 \leq z \leq 2$

$$\Rightarrow F_Z(z) = \frac{1}{2}z \cdot 1 = \frac{1}{2}z$$

$$\therefore f_Z(z) = \begin{cases} z, & \text{if } 0 \leq z \leq 1 \\ \frac{1}{2}, & \text{if } 1 \leq z \leq 2 \\ 0, & \text{otherwise} \end{cases}$$

## HW-5 (due 2008/12/26)

1. Let  $X$  and  $Y$  be independent random variables that are uniformly distributed on the interval  $[0, 1]$ . What is the PDF of the random variable  $Z = X/3Y$
  
2. Let  $X$  and  $Y$  be independent random variables that are uniformly distributed on the interval  $[0, 1]$ . What is the PDF of the random variable  $Z = 2X - 3Y$
